The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca culgaris, angiofibroma of tumberous sclerosis, port-when stains, Sturge Weber syndrome, Oslar-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) is useful for cleaving and cation such as Mg2+. (I) is useful for diagnosis of conditions and

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour anglogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, vertuca vulgaris, anglofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies
                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     expression of Ets-related gene,

           unual communications surrected by administering (I) to the patient in angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes ABK1354-ABK2219 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and related PCR primers of the invention

The present invention relates to nucleic acid molecules which modulate the synchesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, and erlaws, zinzymes, amberzymes, and G-cleaver ribozymes. DNAzymes, compounds, and aptamers that bind to HBV reverse transcriptuse primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV DNA. The nucleic acids may be used to modulate the expression of HBV C genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and isease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV is cibozyme, d-cleaver, zinzyme, DNAzyme or amberzyme sequences
                Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                isolated nucleic acid, useful for treating viral diseases associated a tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Murine oligonucleotide associated with tumour supression, SEQ ID 4476.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

                  The present invention relates to murine oligonucleotides (ACC62754-
ACC68806), which are associated with tumour suppression, tumour
reversion, apoptosis and virus resistance. The oligonucleotides are
useful as (1) as probes and primers for detecting, identifying,
quantifying and/or amplifying nucleic acid, e.g. as one component of a
gene chip; in vitro as (anti) sense reagents; and (2) for production of
recombinant polypeptides. The oligonucleotides are useful for preparation
of pharmaceuticals for prevention and/or treatment of viral diseases that
are characterised by development of tumours or cell degeneration,
specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic, antiviral, neuroprotective, nootropic, neuroleptic, ss;

virus resistance, transgenic animals, Alzheimer's disease, schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to the isolation of 6327 nuclectide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related

Polynucleotides differentially regulated in response to cholesterol and adipogenesis are useful to detect and treat associated conditions such as obesity, athersclerosis, diabetes mellitus and coronary artery heart
                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a composition comprising at least one expression vector comprising a polynucleotide of the invention. The composition has anorectic, antiarteriosclerotic, cardiant and antidiabetic properties. The invention is used to detect and tract conditions associated with elevated cholesterol and lipid or during adipogenesis, particularly obesity, athersclerosis, diabetes mellitus or coronary artery heart disease. This sequence represents a polynucleotide differentially
of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal expression of the nucleotides.
                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     expression vector; anorectic; antiarteriosclerotic; cardiant; antidiabetic; elevated cholesterol; elevated lipid; adipogenesis; obsisty; atherselatosis; diabetes mellitus; coronary artery heart disease; cholesterol homeostasis; ss; differntial expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Shang J,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      disease.
                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 213
```

```
This invention relates to novel isolated nucleic acid sequences involved in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as noted and primers for detecting, indentifying, quantifying and/or camplifying nucleic acid, for example as one component of a gene chip, in virto as antisense reagents and for production of recombinant plantenticals for prevention may therefore be useful for preparation of plypeptides. The invention and/or treatment of viral diseases that characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence data for this patent did not form part of the printed Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2.-OH group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and wutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; ss; probe; myosin-like protein-l; hGDWLP-l;
hGDWLP-l agonist hGDWLP antagonist; hGDWLP inhibitor; heart disorder;
skeletal muscle function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1.3%; Score 14.4; DB 1; Length 17; ilarity 37.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLD-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and 65% identity to (S1). A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63102
                                                                                                                                                                                                                                                                                                 Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ss; probe; myosin-like protein-1; hGDMLP-1;

A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63102
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1.3%; Score 14.4; DB 1; Length 17; 93.8%; Pred.                                                                                                                                                                                                                                                                                                                 The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                          Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter antipacitatic, anticlaborrheic, antidabetic, antidiabetic, antidia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; high bone mass; HBM gene; Zmaxl gene; chromosome 11; 11q13.3; sequence tagged site; STS; osteoporosis; osteopathic; gene therapy; antisense therapy; vaccine; bone disorder; Paget's disease; adapter; sclerostosis; osteomalacia; fibrous dysplasia; PCR primer; linker; ss

                                                                                                                                                                                                                                                   The present invention describes the human Zmaxl gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmaxl and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, paget's disease, sclerostosis, osteomalacia and fibrous dysplasia.

The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HMM) or its wild type gene, Zmax1. Compounds identified by the method are useful for treating, gene, preventing or screening for normal and abnormal lipid associated conditions, including arteriosclerosis, cardiovascular creatment or prevention of diabetic atherosclerosis, neurovascular treatment or prevention of diabetic atherosclerosis, neurovascular conditions caused by plaque build-up, poor circulation due to plaque conditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in build-up and succeed as surrogate markers in pharmaceutical development, and diagnostic assays for bone development, in diagnosis of human or animal bone disease, and in the concling human Zmax1 and HBM, and PCR primers, probes, linkers and advantage of the invantion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; high bone mass; HBM; LRP5; LRP6; transgenic; bone mass modulation; gene therapy; bone density modulation; bone strength; trabecular number; bone size; bone tissue connectivity; bone disease; osteoporosis; PCR; osteomalacia; rickets; Paget's disease; neoplasm of the bone; primer; ss.

The invention relates to novel transgenic animals expressing the high bone mass (HBW) gene, expressing the corresponding wild type HBW gene, comprising an alteration of the gene encoding LRP6 or LRP6, or expressing an LRP5 that is modulated by an altered gene control sequence introduced on LRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation or bone mass modulation. The invention may have a use in gene therapy. The transgenic animals and nucleic acids are for the study of bone density modulation, where the bone mass is modulated relative to non-transgenic animals of the same concerning an more than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The transgenic animals, nucleic acids and mechods are useful for identifying compositions, which may be employed for treating or preventing bone diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also needla in methods for diagnasing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is used in the exemplification of the invention

The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in home mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating home mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) marker, which was used to prepare a physical map of the Zmax1 (LRP5) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated amino acid protein sequence selected from an amino acid sequence appearing as ADRI6922 or an amino acid sequence appearing set ADRI6922 or an amino acid sequence expearing set ADRI6922 or an amino acide ADRI6922 is encoded by the HBM (high bone mass) allele of the human Zmax1 gene and has sequence similarity to LDL receptors. Also disclosed are nucleic acids, proteins, cloning vectors, expression vectors, transformed hosts, methods of developing pharmaceutical compositions, methods of identifying molecules involved in bone development, and methods of idagnosing and treating diseases involved in bone mass (HBM) allele on chromosome 11q13.3 encoding ADRI6922. The protein is useful for treating, diagnosing, preventing, or screening for normal and abnormal conditions of bone, including metabolic bone diseases, e.g. osteoporosis. The present sequence is a PCR primer

The invention relates to an isolated nucleic acid sequence encoding a high bone mass protein (HBM). The gene exists in two alleles, Zmax1, the netional wild-type (the cDNA for which appears as ADR47570 encoding ADR47571) and the HBM allele (the cDNA for which appears as ADR47571 encoding ADR47572) and the HBM allele differ by a single nucleotide of chording ADR47573. The two alleles differ by a single nucleotide of chording vector comprising HBM/Zmax1 (and a replicon operative in an expression vector comprising HBM/Zmax1 operably linked to a transcription regulatory region, an isolated host cell), an expression vector comprising HBM/Zmax1 operably linked to a transcription regulatory region, an isolated host cell action to bone modulation, a method of identifying a molecule involved in bone modulation, a method of identifying a molecule involved in bone modulation, a method of testing for them activity, a method of developing a pharmaceutical for the treatment of bone development disorders, a method of altering bone development in an animal, a method of altering bone development in a host, a dispnostic screening for a genetic predisposition to a bone development disorders, a method of an experience a method of expressing the HBM protein in bone tissue, a bacterial arriticial chromosome comprising HBM/Zmax1 sequence (appearing as

The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34894 - AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
ADR47574-ADR47580), a method for amplifying a nucleotide polymorphism in the Zmax1 or HBM gene, a method for identifying a regulatory element of a HBM gene and an isolated nucleic acid segment of at least 15 contiguous nucleotides including a polymorphic site from HBM/Zmax1. The nucleic acid molecule and the encoded polypeptide, composition, and methods are useful in diagnosing, treating and preventing a bone development disorder, i.e. osteoporosis. The gene for HBM/Zmax1 is located on chromosome 11q13.i.e. The present sequence is a primer used in the mapping of the HBM/Zmax1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primers AAA96393-94 were used to amplify polymorphic microsatellite repeat (PMR) sequences from the human costimulatory receptor gene locus (hCGRL). The primers are used in the method of the invention. The specification describes a method for determining the predisposition of a human subject to develop autoimmune disease. The method comprises detecting a PMR sequence in the CD28, ICOS gene or CTLA4 gene of the human costimulatory receptor gene locus (HCGRL). PMR sequences vary in length among individuals and can be amplified to generate products that differ in size. These products can then be detected by rapid and convenient high resolution processes. The method is useful for determining the predisposition of insulin-dependent diabetes mellitus (IDDM), Addison's disease, Graves disease, autoimmune hypothyroidism, rheumatoid arthritis, Hashimoto's disease, coeliac disease and leprosy. PMR sequences within hCRGL are useful as markers in a variety of assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and in the field of forensic medicine, disease diagnosis and human genome

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and disgnostic methods, as well as the characterisation of the difficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              pharmaceutical agents acting on a disease as well as other treatment. Secondary lymphod chemokines (SLC's), variants, fragments, and the polynucleotides encoding the chemokines, variants and fragments, anti-SLC polynucleotides encoding the chemokines, variants and fragments, anti-SLC antibodies or ligands for the CCR7 receptor can be used to modulate can denditatic cell function in a mammal which results in a decreased primary immune response. SLC can be used to treat cancer or hyperproliferative cimmune response. SLC can be used to pigmented skin lesions. SLC is also useful for treating solid tumours such as melanoma, breast cancer, tumours of the head and neck, cancers or metastases of ovary, endometrium, urinary tract, stomach, testicle, prosetate, lung, bladder, pancreas, bone, liver, colon or rectum, or metastases of unknown primary origin. SLC can also be used to suppress angiogenesis particularly angiogenesis involved in recruitment of leukocytes into sites of inflammation and immune responses, particularly, the chemotaxis of dendritic and other cells. SLC is also useful in preventing graft rejection, prevention and treatment of the autoimmune diseases and for enhancing an immune response. Two primers chemokine CCR2

The invention relates to a compound of 8-50 nucleobases in length targeted to a nucleic acid encoding protein phosphatase 18 (PTP1B), where targeted to a nucleic acid encoding protein phosphatase 18 (PTP1B), where the compound specifically hybridises with and inhibiting the expression of PTP1B in cells are (1) and nucleobase portion of an active site on a nucleic acid encoding or PTP1B; (2) inhibiting the expression of PTP1B in cells or tissues with the compound; treating an animal experising contacting the cells or tissues with the compound; treating an animal newprising administering the compound; (4) decreasing blood sugar levels in an animal comprising administering the compound; (5) preventing or delaying the onset of a disease or condition associated breventing or delaying the onset of an increase in blood glucose levels in an animal comprising administering the compound; (6) preventing or delaying the onset of an increase in blood glucose levels in an animal comprising administering the compound; not compound is used to inhibit the expression of PTP1B in cells or tissues, to treat or condition associated with prevent or delay the onset of a disease or condition associated with prevent or delay the onset of a disease or condition, and for animal having or suppected of having the disease or condition, and for decreasing blood sugar levels or preventing or delaying the onset of an inmal animal. The compound is also used in diagnostics, therapeutics, prophlaxis, and in research reagents and kits. The present sequence is an antisense compound of the invention kits. The present enables and animal. The compound is also used in diagnostics, therapeutics, prophlaxis, and in research reagents and treasenting human PTP1B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (PTP1B)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Compound for inhibiting the expression of protein phosphatase 1B (PTP: and for treating diabetes, cancer, or obesity, comprises an antisense oligonucleotide targeted to nucleic acid encoding PTP1B.

Also described: (1) a composition comprising (C) and a carrier or diluent; (2) inhibiting the expression of VEGFR-1 in cells or tissues by contacting the cells or tissues with (C) so that the expression of VEGFR-1 is inhibited; and (3) treating an animal having a disease or condition associated with VEGFR-1 by an animal having a disease or condition associated with VEGFR-1 is inhibited. (C) has antiangogenic, antirheumatic, antiarthritic, administering (C) to the animal so that the expression of VEGFR-1 is inhibited. (C) has antiangogenic, antirheumatic, antiarthritic, contaction of VEGFR-1 and for treating diseases or conditions associated with the expression of VEGFR-1, such as hyperproliferative disorders (e.g. cancer), rheumatoid arthritis, or diseases or conditions involving the expression of VEGFR-1, such as hyperproliferative disorders (e.g. cancer), rheumatoid atthritis, or diseases or conditions involving the expression of VEGFR-1, such as hyperproliferative disorders (e.g. cancer), rheumatoid atthritis, or diseases or conditions involving the expression of VEGFR-1, such as hyperproliferative disorders (e.g. cancer), rheumatoid are also useful for diagnostics, the conditions involving the conditions are also useful for diagnostics, the cancer of the cancer of the conditions are also as a conditions and conditions and conditions are also useful for the cancer of the canc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "This oligonucleotide has a phosphorothioate backbone and 2'-O-methoxyethyl (2'-MOB) wings at the 5' and 3' ends, which are 5 nucleotides in length. Also all cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. The present sequence represents a human VEGFR-2 chimeric phosphorochioate antisense oligonucleotide, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotide targeted to a nucleic acid encoding vascular endothelial growth factor receptor-1, useful for diagnosing or treating cancer, rheumatoid arthritis, or diseases or conditions

ö The present invention describes compounds (I) comprising 8-50 nucleobases in length targeted to a nucleic acid molecule encoding a microsomal triglyceride transfer protein, where the compounds specifically hybridise with and inhibit the expression of the microsomal triglyceride transfer protein. Also described: (I) a compound 8-50 nucleobases in length which appecifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding microsomal triglyceride transfer protein; (2) a composition comprising (I) and a carrier or Microsomal triglyceride transfer protein antisense oligonucleotide #91. hybridisation; microsomal triglyceride transfer protein inhibitor; cardiant; antiarteriosclerotic; antilipaemic; antisense gene therapy; abnormal lipid metabolism; abnormal cholesterol metabolism; atherosclerosis; cardiovascular disease; mouse; phosphorothioate; ss; New antisense oligonucleotide compounds, useful for diagnosing, preventing and/or treating conditions with aberrant activity of the microsomal triglyceride transfer protein, such as atherosclerosis and Gaps triglyceride transfer protein; antisense oligonucleotide; /note= "phosphorothioate linkages, and all cytidine residues are 5-methylcytidines" ö Indels 1.3%; Score 14.4; DB 1; 13.8%; Pred. diluent; (3) inhibiting the expression of microsomal triglyceride

transfer protein in cells or tissues, comprising contacting the cells or

tissues with (1) so that expression of microsomal triglyceride transfer

protein is inhibited; and (4) treating an animal having a disease or

condition associated with microsomal triglyceride transfer protein,

condition associated with microsomal triglyceride transfer protein,

condition associated transfer protein is inhibited. (1) have cardiant,

antisense gene therapy. The methods and compositions of the present

antisense gene therapy. The methods and compositions of the present

conditions associated with aberrant expression or activity of

diseases or conditions associated with aberrant expression or activity of

microsomal triglyceride transfer protein, such as an abnormal lipid or

cholesterol metabolism condition like atherosolarosis and cardiovascular

disease. The present sequence represents a mouse microsomal triglyceride

transfer protein chimeric phosphorothioate antisense oligonucleotide,

which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to producing a cloned cell containing a stably silenced target gene. The method involves introducing a nucleic acid molecule expressing a chimeric repressor fusion protein into a parent cell. The repressor fusion protein comprises a first amino acid sequence comprising a Kruppel-Associated Box (KRAB) domain or its variant that binds to the protein KAPI and has DNA-dependent repressor activity fused to a second amino acid targeting sequence that binds to the target gene, fused to a switch component, that, in the presence of a ligand or inducer, permits the second amino acid sequence to bind to the target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Producing a cloned cell containing a stably silenced target gene, useful in research and drug screening, comprises introducing a nucleic acid molecule expressing a chimeric repressor fusion protein into a parent

All cytidine
gene, where the fusion protein is under the control of regulatory sequences capplel of directing its expression in the parent cell. The sequences capplel of directing its expression in the particularly useful in research and drug screening, e.g. identifying a test molecule that activates the expression of a stably silenced target gene, or manipulating expression of target gene in a cell. Sequences ACF36598-99 represent primers used in a RT-PCR assay for detecting levels of Colla2mRNA in NIH373 cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding PTP1B, useful for treating a disease/condition associated with PTP1B, such as cancer, diabetes or obesity.

                                                            This invention relates to novel compositions and methods for modulating the expression of PTPIB (also known as protein phosphatase 1B and PTPNI). Specifically, it refers to antisense compounds that can target and hybridise with a nucleic acid molecule encoding PTPIB, as well as splice variants thereof and inhibit expression accordingly. PTPIB is a tyrosine phosphatase that plays an essential regulatory role in signalling mediated by the insulin receptor and as such is useful for treating diseases such as type 2 diabetes and obesity. Furthermore, FTPIB can suppress transformation of oncogenic genes, such that compositions of this invention can also be used to treat hyperproliferative conditions including cancer. Accordingly, these compounds can be described as having cytostatic, antisberse DNA oligo that targets human PTPIB DNA, and which has a phosphorothicate backbone and 2'-0-methoxyethyl wings, used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of producing a transformable corn line by introgressing at least one chromosomal locus mapping to bin 6.02-6.04 or bin 10.04-10.06, where the locus is introgressed from a more transformable corn line into a less transformable corn line. The invention also relates to corn variety 178-187-20 seed (ATCC accession co. PTM-5183) and corn variety 178-187-25 seed (ATCC accession no. PTM-5182); progeny of a plant grown from the seed cited above, where the progeny comprises loci mapping to chromosomal bins 1.03-1.06, 1.08-1.11, 2.05-3.07, and 6.02-6.04; a transgenic corn plant produced by transforming the progeny cited above; and hybrid corn seed and plants produced by crossing a corn line with the progeny cited above. Because
                                                                     The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25511), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing a transformable corn line comprises introgressing at least c
chromosomal locus mapping to bin 6.02-6.04 or 10.04-10.06, where the
locus is introgressed from a more transformable corn line into a less
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
more transformable lines are typically agronomically poor, while lines with superior or desired agronomic traits tend to be less transformable, the methods of the invention provide a means of testing for the effects of an introduced gene on traits such as yield, kernel quality and plant phenotype in earlier plant generations in a breeding programme. Sequences ADN61671-ADN61702 represent PCR primers used in an example of the invention to amplify corn SSR markers useful in marker assisted breeding.
                                                                                                                                                                                                                                                                                                                                                 Human, antisense; ss; Huntingtin interacting protein 1; HIP1; cellular apoptosis; Huntington's disease; chromosome 7q11.23.

ö

New compound that modulates huntingtin interacting protein 1 expression, useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis.

WPI; 2004-374983/35.

Dobie KW;

Example 15; SEQ ID NO 120; 85pp; English.

The invention relates to a compound targeted to a nucleic acid molecule encoding huntingtin interacting protein 1, HIP1. The compound, 8-80 nucleobases in length, is an antisense oligonucleotide, where the compound specifically hybridises with the nucleic acid molecule encoding huntingtin interacting protein 1 comprising a sequence appearing as ADNO1766 and inhibits the expression of huntingtin interacting protein 1. Also included are inhibiting the expression of huntingtin interacting protein 1 in cells or tissues, screening for a modulator of huntingtin interacting protein 1, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with huntingtin interacting protein 1 compound so that expression of huntingtin interacting protein 1 is inhibited. The compound and the methods are useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis e.g. Huntington's disease. The HIPI gene is located on chromosome 7q11.21. The present sequence is an antisense target region from the HIPI cDNA.

Sequence 20 BP; 3 A; 9 C; 5 G; 3 T; 0 U; 0 Other;

The compound, 8-80 nucleobases in length, is an antisense oligomucleotide, where the compound specifically hybridises with the nucleic acid molecule encoding huntingtin interacting protein 1 comprising a sequence appearing as ADNO1766 and inhibits the expression of huntingtin interacting protein 1. Also included are inhibiting the expression of huntingtin interacting protein 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compound that modulates huntingtin interacting protein 1 expression, useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Phosph-rothioate linkages and all cytidines are-methylcytidines" % \left( \frac{1}{2}\right) =\frac{1}{2}\left( \frac{1}{2}\right) =\frac{
useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis e.g. Huntington's disease. The HIP1 gene is located on chromosome 7q11.23. The present sequence is an antisense oligonuclectide of the invention.

```
The invention relates to a compound targeted to a nucleic acid molecule encoding huntingtin interacting protein 1, HIP1. The compound, 8-80 nucleobases in length, is an antisense oligomucleotide, where the compound specifically hybridises with the nucleic acid molecule encoding huntingtin interacting protein 1 comprising a sequence appearing as ADN01766 and inhibitis the expression of huntingtin interacting protein 1.

Also included are inhibiting the expression of huntingtin interacting protein 1, a diagnostic method for identifying a disease interacting protein 1, a diagnostic method for identifying a disease of animal having a disease or condition associated with huntingtin interacting protein 1 compound so that expression of huntingtin interacting protein 1 is inhibited. The compound and treating an animal having a disease or condition involving dysrequiation of cellular apoptosis e.g. Huntington's disease. The HIP1 gene is located on chromosome 7q11.23. The present sequence is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New compound that modulates huntingtin interacting protein 1 expression, useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis.
                                                                                                                                                     interacting protein 1 compound so that expression of huntingtin interacting protein 1 is inhibited. The compound and the methods are useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis e.g. Huntington's disease. The HIPI gene is located on chromosome 7q11.23. The present sequence is an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonuclectides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition. They are also useful in research and disgnostics for modulating the expression of GFAT. The present sequence represents a chimeric expression of GFAT. The present sequence represents a chimeric phosphorochioate oligonucleotide with 2'-MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GFAT), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Glutamine-fructose-6-phosphate amidotransferase; diabetes; ischemia;

Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                         0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GFAI), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.

The present invention relates to a Single Condition Amplification/
Internal Primer (SCAIP) sequencing method for direct sequence analysis of
Internal Primer (SCAIP) sequencing method for direct sequence analysis of
In multi-exon genes from genemic DNA samples and identifying mutations
in multi-exon genes e.g. the dystrophin gene, CAPN3 gene and DYSF gene.
Mutations in the dystrophin gene result in both Duchenne Muscular
CAPN3 gene, encoding calpain (calcium-activated neutral protease) result
in limb-girdle muscular dystrophy type 2A (LGMDZA) and mutations in the
DYSF gene, encoding dysferlin, result in limb-girdle muscular dystrophy
CC type 2B (LGMDZB). The method comprises bringing into contact in each of
the reaction chambers an amplicon from a different one of the
amplification reactions and one or more internal sequencing primers
corresponding to the amplicon and analysing the sequences of the
corresponding to the amplicon and analysing the sequences of the
analysis of any large multi-exon gene. It is also useful for the
indentification and analysis of specific individual genemic mutations
indentification and analysis of specific individual genemic mutations
                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          including deletions, point mutations, or its combinations, gene complexes with multiple exons/introns spanning large genomic regions. The present sequence is a PCR primer, used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                              Human; SCAIP; CAPN3; DYSF; calpain; calcium-activated neutral protease; limb-girdle muscular dystrophy type 2A; LGMD2A; dysferlin; limb-girdle muscular dystrophy type 2B; LGMD2B; PCR; primer; 8B; Single Condition Amplification/ Internal Primer.

This invention relates to a protein that exhibits calcium ion channel transmissive activity and is activated by pregnenolone sulphate.

Specifically, it refers to a novel screening method for identifying a cubstance that is useful as a memory improving agent, a learning ability improving agent and/ or an antidementia agent. The present invention describes this acreening tool as one that involves contacting a test substance with cells expressing the calcium permeable nonselective cation channel and analysing the channel activity to select only those cubstances, for example pregnenolone sulphate, which can activate the channel. As such, it provides a means to develop pharmaceutical compositions comprising these substances that can be used to treat dementia, as well as improving memory and learning functions.

Accordingly, they act as calcium channel agonists and exhibit nootropic and neuroprotective activities. This oligonucleotide sequence is a PCR primer given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide with calcium ion channel transmissive activity, activated by pregnenolone sulfate, useful for screening memory improving agent, learning ability improving agent and/or anti-dementia agent.

                                                                                                                                                                                                                                                                                                                                                                                                                              characteristics of which change when the probe is hybridised to the target sequence, can be used to detect target mucleic acid in a convenient single step method. The new probes allow homogeneous assays to be performed without the need to seperate unhybridised probe. If the probe is added before PCR amplification of target DNA, the PCR time profile can be monitored by measuring the flourescent intensity of the reaction mixture. The flourochrome is preferably thiazole orange or oxazole yellow. The method avoids the problem of nonspecific intercalation associated with the use of free flourchromes
                                                                                                                                                                                                                                                                                                                                                    Oligo:nucleotide probes with intercalating fluoro:chrome label - only fluoresces when bound to target sequences, removes need to separate unhybridised probes.

Assessing risk of severe iron overload, e.g. in subjects with hereditary
                                                                                                                                                                                                                                                             breast cancer gene CH13-2a12-1 by differential display. The identified genes cancer gene CH13-2a12-1 by differential display. The identified genes or fragments of these genes can be used for identifying genes and gene products that are initimately related to malignant transformation or maintenance of the malignant properties of cancer cells. It can also be used to design or screen diagnostic reagents or therapeutic compounds. Kits are included within the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hereditary hemochromatosis gene; HFE gene; iron overload; hereditary atransferrinemia; hypotransferrinemia; aceruloplasminemia; polymetabolic syndrome; chronic liver disease; hematological disease; delayed cutaneous porphyria; hematochromatosis; PCR primer; ss.

                                                                             PCR primers AAA46189-90 were used to amplify a fragment of the human hereditary hemochromatosis (HFE) gene. The primers were used in the method of the invention. The specification describes a method for evaluating the risk of developing severe iron overload, particularly in a predisposed subject. The method comprises determining the profile of the different transcripts of the HFE gene in a biological sample. The method origin, e.g. in cases of iron overload, of inherited or acquired origin, e.g. in cases of hereditary or juvenile hematochromatosis, polymetabolic syndrome, chronic liver disease, delayed cutaneous porphyria or hematological alsease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel stabilising reaction reagent for use in the amplification and/or detection of a target nucleic acid comprising: preparing a reaction mixture with e.g. a nucleic acid as template, at least 1 primer and RNaseH; and incubation of the reaction mixture for a defined period of time to form a reaction product during the amplification of such target nucleic acid. The method is useful for stabilising and long-term storage of reaction reagents for highly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Stabilising reaction reagent; PCR; primer; RNaseH; long-term storage; specific amplification; pathogenic microorganism; chimeric; genetic engineering; clinical medicine; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to assessing a culture of undifferentiated primate pluripotent stem cells (ppS, e.g. embryonic stem cells), involving detecting expression of markers (WHI) e.g. Zic family member 3 (ZIC3), as given in specification, other than human telomerase reverse transcriptase (hTERT) or octamer binding transcription factor (Oct)3/4, or a marker (WR2) such as cripto or podocalyxin-like protein and hTERT and/or Oct3/4 or second marker chosen from (WR2). Also included are maintaining (MZ) ppS cells in a pluripotent state (involves causing them to express one of the following markers (MR3) at a higher level, FOXOLA, ZIC3, hypothetical protein FLU2082, Forkhead box H1 (FOXH1), Zinc finger protein, Haal2, KRAB-zinc finger protein of cerebellum
sensitive and specific amplification and detection of nucleic acids particularly in identifying pathogenic microorganisms or viruses in a sample using chimeric oligonucleotide primers, which is useful in genetic engineering and clinical medicine. This polynucleotide sequence represents an oligo relating to the novel stabilising reaction reagent method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cells by

Selecting siRNA by selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the functionality of the nucleotide sequences that are complementary to a stretch of nucleotides The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3' terminal is adenine, thymine or uracil; (ii) the base at 5' terminal is guanine or cyclosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cytotoxicity. The method is used for designing and synthesizing siRNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention. Detecting sequence of RNA interference useful for synthesizing siRNA, by detecting regions in sequence fulfilling specific criteria such as base at 3' terminal is adenine, thymine or uracil, base at 5' terminal is Gaps gene silencing; Bcl-2; optimised; short interfering RNA; The invention relates to a novel method for selecting siRNA (short interfering RNA) comprising selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the . 0 1.3%; Score 14.2; DB 1; Length 19; 34.2%; Pred. The invention relates to assessing a culture of undifferentiated human embryonic stem (hES) cells (undifferentiated primate pluripotent stem cells) or their progeny, involves detecting or measuring a marker such as cripto (teratocarcinoma-derived growth factor), gastrin-releasing peptide (GRP) receptor and podocalyxin-like protein, and either hTERT (telomerase cripto (teratocarcinoma-derived growth factor), gastrin-releasing peptide (GRP) receptor and podocalyxin-like protein, and either hTERT (telomerase creverse transcriptae) and/or Oct3/4 (also known as POU domain, class 5, transcription factor 1(POUST)), or GRP receptor. The method involves guantifying the proportion of undifferentiated hES colls and detected or measured at the protein level by antibody assay. The method involves quantifying the proportion of undifferentiated hES cells or differentiated cells in the culture from the marker expression. The level of the marker is determined to be at least 100-fold higher than the level of the marker is determined to be no less than 100-fold lower than the level of the marker in medium conditioned with mouse embryonic the relevable than the level of the marker in medium conditioned with mouse embryonic method further involves modifying the culture conditions on as to cause through an extracellular matrix in medium conditions of cancer, for easesing culture. The method is useful for characterising pluripotent stem cells and their differentiated hES cells or their progeny. The marker used in the above method is useful for characterising pluripotent stem cells and their differentiated progeny, for clinical diagnosis of cancer, for assessing and manipulating culture conditions, regulating gene expression. The separation and purification, and to influence differentiation. The separation is useful for characterising deferentiated because the sequence is a real time of influence differentiated to assay mans arreading and purification, and to influence differentiation. The marker used to assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic; cytostatic; anticonvulsant; nootropic; muscula; anti-HIV; MAX interference; iRNA; antisense technology; liptid metabolism; cholesterol imbalance; dyaliquaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; diabetes; cancer; breast cancer; colon cancer; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; ALDS; apolipoprotein B; apoB; ss.

The invention describes a RNA interference (IRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical phosphorothioate modifications compenses to a cone or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are:

Cc and the antisense sequence targets a human gene sequence. Also described are:

Cc are: a pharmaccutical preparation comprising (I); reducing (I); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). Ii is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.

Cc that can be dispense or administer or glucose-6-phosphatase levels.

Cc that can be dispense or administer of useful (I). Ii is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.

Cc that can be dispense or administer or glucose-6-phosphatase levels.

Cc that can be dispense or administer or glucose-6-phosphatase levels.

Cc the can be dispense or administer or glucose-6-phosphatase levels.

Cc the can be dispense or administer or glucose-6-phosphatase levels.

Cc the can be dispense or administer or glucose-6-phosphatase levels.

Cc the can be dispense or dispense or dispense (CD) coronary heart or disperse or glucose production or for treating glucose-metabolism-classed (CBD) and atheroselectosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-classed dispenses as mentioned above, cancer (CBD) broast, colon or creating the diseases as mentioned above, cancer (CBD) and adverses or can be appliable or contary heart or contary heart or contary he
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 14.2; DB 1; Length 19;

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical prosphorothioate modifications con or more asymmetrical prosphorothioate modifications sequences have one or more asymmetrical prosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (MI) apob-100 evels or glucose-6-phosphatase levels in a subject; producing (II); creations or glucose-6-phosphatase levels in a subject; producing (II); creations one or more asymmetrical modification in the sequence, where introducing one or more asymmetrical modification in the sequence, where crivity; a kit comprising (I) and instruction for its use; and a device crivity; a kit comprising (I) and instruction for its use; and a device crivity; a kit comprising (I) and instruction for its use; and a device useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted construction and processed of the disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholestorolaemia, statin-resistant chosen from the HDL/LDL cholesterol imbalance, disease (CHD) and atherosclerosis: (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-crivity is useful for related disorder e.g. disabetes or type-2 disabetes. (I) is useful for
                                                                                     Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                       Example 5; SEQ ID NO 3052; 378pp; English.

come or more asymmetrical 2'-0 alkyl modifications, the antisense sequences have one or more asymmetrical 2'-0 alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioace modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaccutical preparation comprising (1); reducing (M1) apoB-100 care: a pharmaccutical preparation comprising (1); reducing (M1) apoB-100 care: a pharmaccutical preparation comprising (1); reducing (M1) apoB-100 cativity; a kit comprising (1) and instruction in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (1) and instruction for its use; and a device that can be dispense or administer a composition comprising (1). (1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. Cherwise unwanted expression of apoB-100, elevated or otherwise unwanted composition of apoB-100, elevated or otherwise unwanted captesion of apoB-100, elevated or otherwise unwanted 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic; anticonvulsant; noctropic; muscula; anti-HIV; cytostatic; anti-convulsant; noctropic; muscula; anti-HIV; RNA interference; iRNA; antisense technology; lipid metabolism; coholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CAD; atherosclerosis; hepatic glucose production; cheracholism-related disorder; diabetes; cancer; breast cancer; colon cancer; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; ADS; apolipoprocein B; apoB; ss.
invention describes a RNA interference (iRNA) agent (I) comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ð
                                                                                                                                                                                                                                                                                                                                                      The invention describes a RNA interference (IRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have cone or more asymmetrical 2'-0 alkyl modifications, the antisense cone or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (II); devels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence; where controducing one or more asymmetrical modification in the sequence, where introducing one or more asymmetrical modification in the sequence, where controducing one or more asymmetrical modification in the sequence, where introducing appense nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is conseful for reducing apoB-100 levels or glucose-6-phosphatase levels.

The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted contends and a disorder or disperse or contends and a disease (CD), coronary heart disease (CD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism.

The attend disorder e.g. diabetes or type-2 diabetes. (I) is useful for relating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or currel human apolipoprotein B (ApoB) antisense eleg. it is useful for represents a human apolipoprotein B (ApoB) antisense elegence or epicence or produced or outled or outled 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The sequences given in AAQ35764-73 were used to generate NYVAC and ALVAC-
based recombinants expressing the Hantaan virus G1 and G2 glycoproteins.

The expression of these glycoproteins was accomplished by insertion of
the M segment into the ALVAC and NYVAC vectors under the control of the
CC 42 kD promoter. NYVAC is derived from a canarypox virus which has been
cc vaccinia virus and ALVAC is derived from a canarypox virus which has been
cc vaccinia virus and ALVAC is derived from a canarypox virus which has been
cc were engineered as recipient loci for the insertion of foreign genes.

The ALVAC is derived from a canarypox virus which has been
cc were engineered as recipient loci for the insertion of foreign genes.

The engineered as recipient loci for the insertion of foreign genes.

The ALVAC is and was fused to a PCR-derived fragment containing the 42
creation (PCR) and was fused to a PCR-derived fragment containing the 42
cc promoter element. The 42 kD promoter was isolated from Amsacta moorei
cutomorpoxvirus (AmsPV). The 3' region of the M segment coding sequence
was also isolated by PCR and the TSV motif was disrupted. The plasmid
containing the M-specific cDNA clone was used to create an expression
cassette. The expression cassette was introduced into the large subunit,
cribonucleotide subunit (141) open reading frame (ORF) of NYVAC or the CALVAC ORF of NYVAC.

                                                                                                                                                                                                                                                                                                                                                                 The primers (AAQ53267-86) are used to amplify the genomes of various viral plant pathogens or satallite viruses. The pathogen is then imobilised using antibodies against proteins in the virus coating or against double-chain RNAs in the case of viral pathogens. Detection of the pathogen is carried out by electrophorectic identification of the amplification products. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003)

New peptide nucleic acid (PNA) oligomers are provided which (a) consist of naturally occurring nucleobases covalently bound to a polyamide backbone and (b) hybridise to the translation initiation AUG region, coding region, 5' untranslated region (5' UTR) or 3' untranslated region (6' UTR) or 6' Extranded DNA (ssDNA) to produce antisense-type gene regulation moieties. They inhibit expression of PKC-alpha and its isoforms (including beta, gamma, delta, epsilon, zeta and eta) and so are useful for treating and diagnosing cell proliferation and differentiation processes such as neoplastic, hyperproliferation and differentiation processes such as neoplastic, hyperproliferation and inflammatory diseases. PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first complementary and a second RNA strand binds with the cranding double helix or with the first PNA strand. The PNAs possess no significant charge and are water soluble, which facilitates cellular uptake. Further, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proteases. The present sequence targets the coding region of PKC-epsilon. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
/note= "at least one (and preferably all) of the backbone subunits are composed of N-acetyl N-(2-aminoethyl)glycine peptide residues, the nucleobase being attached covalently to the acetyl group and the peptide linkage being formed by condensation of the glycine carboxy group of one residue with the amino group of the 2-aminoethyl moiety in the next residue"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense; protein kinase C; alpha; PKC; beta; gamma; eta; epsilon; zeta; modulation; expression; isozyme; hybridise; S' UTR; human; 3' untranslated region; translation initiation site; detection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptide nucleic acid oligomers specific for protein kinase C isozyme(s) - useful as anti:sense molecules for treating PKC mediated disease, e.g. cancer, psoriasis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                 The sequences given in AAQ84252-64 are oligos which are antisense to the protein kinase C-epsilon (PKC-epsilon) cDNA. These antisense molecules can be used in modulating the expression of this particular isozyme of PKC. These oligonucleotides have a %inhibition of PKC of <40%. The coligonucleotides have a %inhibition of PKC of <40%. The coligonucleotides of the invention preferably hybridise with the 5'- or 3' cultranalated regions of the PKC gene, or the translation initiation site, or the coding region. These oligos may be used in the detection of the human PKC, esp. hyperpooliferative diseases such as psoriasis, associated with PKC, esp. hyperpooliferative diseases such as psoriasis, contenia at least one phosphorothioate linkage and/or at least one of the nucleotides comprises a modification on the 2' position of the sugar, correct PN field.)

```
The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic comparisons to be made between more species
                                                                                                                                                                                         New oligonuclectide primers amplifying gene regions conserved among mammals - useful for developing genomic maps, isolating clones and making

This invention describes antisense oligonucleotides that specifically bland to human protein kinase C (PRC) mRNA. These oligonucleotides can be used to inhibit PKC mRNA and therefore be used to treat PKC-related hyperproliferative conditions, e.g. cancer, especially colorectal cancer, breast cancer, lung cancer, or brain cancer (preferably glioblastoms multiforme). The products of the invention may also be used to treat skin cancer and psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a direct repeat from the Hz-1 persistence-sesociated gene 1 (Hz-1 pagl). The invention relates to the Hz-1 pagl promoter. The pagl gene promoter is useful in insect cells for driving constitutive expression of e.g. genes encoding foreign proteins. The promoter of the pagl gene is constitutively expressed and stronger than that of the polyhedrin gene in insect cells, enabling it to express foreign genes more strongly e.g. lacZ and luciferase, in addition to which it can be expressed more prominently as a short promoter. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hz-1 pag1 promoter; persistence-associated gene 1; insect cell;

This invention describes novel oligonucleotides (AAX78524-X78644) having up to 50 nucleotides hybridisable with, and able to modulate the expression of, a nucleic acid encoding protein kinase C and its isozymes alpha, beta type II, beta type II, gamma, eta, dalta, epsilon and zeta. The oligonucleotides of the invention have anti-inflammatory and cyprestatic activity and are used for antisense targeting to modulate the expression of PKC or of a particular PKC isozyme or set of isozymes in cells or tissues. The products of the invention also hybridise with number or be involved in the modulation of PKC expression, which is nucleic acids involved in the modulation of PKC expression, which is conditions e.g. psoriasis but to the involved in the modulation of pkC expression, which is conditions e.g. psoriasis but to the their specificity the oligonucleotides are able to overcome the problems of toxicity associated with previous agents designed to modulate PKC expression
                                                                                                                                                                         PKC; human; PKC-alpha; primer; protein kinase C; expression modulator; PKC-beta type I; PKC-beta type II; PKC-gamma; PKC-eta; PKC-delta; PKC-espailon; PKC-esta; anti-inflammatory; cytostatic; antisense targeting; isozyme; growth control; hyperproliferative disease; colon cancer; glioblastoma; bladder cancer; inflammatory condition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonucleotides targetted against nucleic acids encoding protein kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method of inhibiting the expression of human protein kinase C (PKC) in cells. The method comprises contacting the cells with an antisense oligonucleotide which has up to 50 nucleotide cunits. AAX83720 represent specifically claimed antisense oligonucleotides for use in the method of the invention. The antisense oligonucleotides for use in the method of the provention. The antisense coligonucleotides modulation of expression of the PKC gene which results in modulation of expression of the PKC gene. This means they can be used for diagnosis, therapeutic or prophylactic treatment of PKC associated diseases such as cancer and psoriasis, and as research agents. Abnormal proliferative states in tissue from patients suspected of diagnosed. Tumours associated with PKC can be distinguished from tumours which are not PKC associated to allow an efficacious treatment regime to be used. The antisense oligonucleotides have specific activity so are called to modulate PKC activity without producing side effects and with greater effectiveness than observed from administration of current carriers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antisense oligonucleotides specific for human protein kinase C useful diagnosis and treatment of cancer and psoriasis.

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinuatis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX1564-AAX15879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX491990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, simusitis, purulent citis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae mucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                    and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as supermoniae and bronchities and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX1584 - AAX15879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                   Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

The present invention specifically describes antisense oligomucleotides of up to 50 nucleotides in length which specifically bind human protein kinase C-alpha (PKC-alpha) mAX19127 to AAX19247 represent antisense coligomucleotides from the present invention which bind human PKC-alpha, -delta, epsilon, -zet and -eta. The antisense coligomucleotides modulate the expression of the PKC gene (i.e. inhibit oligomucleotides modulate the expression of the PKC gene (i.e. inhibit coligomucleotides modulate the expression of the PKC gene (i.e. inhibit colligomucleotides of propomucleotides can be used to diagnose to apport any partients of the PKC gene). The antisense oligomucleotides can be used to distinguish PKC-associated two partiens and to detect and diagnose PKC expression (through the use of 32P cumours and to detect and diagnose PKC expression (through the use of 32P coligomucleotides can also be used to perform autoradiography of tissues coligomucleotides can also be used to perform autoradiography of tissues coligomucleotides eliminate the side effects associated with the antisense oligomucleotides eliminate the side effects associated with the antisense oligomucleotides eliminate the side effects associated with the gene rather than inhibiting the enzyme itself. (Updated on 20-grown are methods because it modulates the amount of PKC protein made con 20-grown and 2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         U

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes antisense oligonucleotides up to 50 mucleotides in length which specifically bind mRNA encoding human protein kinase C (PKC). AAZ27266 to AAZ27368 represent human PKC antisense oligonucleotides used in the exemplification of the present invention. The antisense oligonucleotides are useful for the treatment of diseases associated with PKC expression, such as Myperproliferative and inflammatory conditions including psoriasis, tumours and cancer (glioblastoma, bladder, breast, colon and lung cancer)
                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense oligonucleotides useful for treatment of hyperproliferative and
phosphorothioate; hybridisation; isozyme; target; inflammation;
hyperproliferative disorder; psoriasis; tumour; cancer; glioblastoma; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human biallelic marker downstream amplification primer SEQ ID NO:9409.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome; biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; amplification; single nucleotide polymorphism; SNP; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

invention, which contain a polymorphic base at position 24 of their invention, which contain a polymorphic base at position 24 of their invention, which contain a polymorphic base at position 24 of their concledes. AAZ69579 to AAZ7740 represent amplification in partice for the biallelic markers of the invention primers for the biallelic markers of the invention primers for the biallelic markers of the invention concerns a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficactions and side effects from pharmaceutical agents acting on a disease as well as other treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                      The present sequence is an antisense oligonucleotide designed to inhibit expression of the human X-linked inhibitor of apoptosis. This sequence is trargeted to the start codon region of the gene. The oligonucleotides may be modified to consist of 10 mucleotides flanked on both sides by 5 mucleotide wings. The wings are composed of 2'-methoxyethyl (2'-MOE) nucleotides Cyridine residues in the 2'-MOE wings are 5-methylcytidines. Throughout the modified oligonucleotides, the internucleoside linkages are phosphorothicate. The modified oligonucleotides are more effective inhibitors than unmodified oligonucleotides. The oligonucleotides may be used to inhibit X-linked inhibitor of apoptosis expression in cells and tissues in vitro. The oligonucleotides are also useful for treating animals or humans, prone to a disease associated with X-linked inhibitor of apoptosis. The oligonucleotides may also be used prophylactically to
                                                                                                                                        Antisense compound useful for research reagents, diagnostics, prophylaxis and for treating disorders associated with X-linked inhibitor of apoptosis, modulates expression of X-linked inhibitor of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                   Arabidopsis thaliana VRNI. This protein is capable of altering the vernalisation responses of a plant. Also provided are a number of PCR primers used to isolate the sequences. The sequences are useful in the production of crop plants, where they are able to control the timing of flowering, the duration of vernalisation required, the optimum temperature, or even eliminate the need for vernalisation completely. The present sequence is a PCR primer used to isolate the VRNI coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated polynuclectide useful for producing fibronectin binding proteins which are useful in production of vaccine, in diagnostic assays and for prophylactic and therapeutic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a Campylobacter jejuni or Campylobacter coli fibronectin binding protein (CadF). A recombinant expression vector with cadF is useful in an assay for determining the presence of C.jejuni or C.coli in a test sample or for determining whether a test isolate of Campylobacter is a strain of C.coli. cadF is useful in the construction of DNA probes for identifying and quantifying the level of expression of CadF in a cell. The gene can also be used in a vaccine
Novel VRN1 polynucleotide sequence encoding a polypeptide which alters vernalization response of plant in which VRN1 nucleic acid is expressed, useful for influencing and assessing vernalization phenotype of plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fibronectin binding protein; CadF; vaccine; diagnostic assay; ss.

Sequences AAC92560-C92639 represent antisense oligonuclectides targetted to the human nucleolin gene, which inhibit its expression. The antisense oligonuclectides were designed to target different respions of the human nucleolin mRNA, and were analysed for their effect on nucleolin mRNA levels by quantitative real-time PCR. Nucleolin (also known as P92 or C32) is the most abundant nucleolar phosphoprotein in actively growing cells. Nucleolin primarily participates in ribosome biogenesis and transport of ribosomal components, being able to transiently bind to preriosomes in the nucleolus via a ribonucleoprotein consensus sequence. Thewever, it has also been shown to be involved in cyrokinesis, nucleogenesis, cell proliferation and growth, transcriptional repression, replication, signal transduction, and chromatin decondensation. Nucleolin replication, signal transduction, and chromatin decondensation. Nucleolin is a member of the Ag-NOR (active ribosomal gene located in the nucleolar or inbosomal genes, and whose expression is associated with the prediction of tumour growth rate. The presence of antibodies against nucleolin are associated with systemic connective tissue diseases such as systemic cincential and sclerodermaliate with systemic connective tissue diseases such as systemic connective diseases. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with nucleolin Human nucleolin phosphorothioate antisense oligonucleotide, SEQ ID NO:36. Novel antisense compound targeted to human nucleolin which specifically hybridizes with and inhibits the expression of human nucleolin, useful for modulating the expression of nucleolin in cells. expression, such as tumour formation, immune disorders and inflammation Gaps Human nucleolin; P92; C23; phosphoprotein; ribosome biogenesis; ribosome transport; cytokinesis; nucleogenesis; cell proliferation; cell growth; transcriptional repression; replication; esignal transduction; chromatin decondensation; Ag-NOR family; nucleolin antibody; systemic connective tissue disease; SLE; systemic lupus erythematosus; scleroderma-like chronic graft versus host disease; escleroderma-like chronic graft to the chromic praction; cancer; inflammation; immune disorder; phosphorothioate; antisense oligonucleotide; ss. ö 3; Indels Sequence 20 BP; 4 A; 7 C; 2 G; 7 T; 0 U; 0 Other; 0; Mismatches Example 15; Col 41-42; 41pp; English TTATGTTACTTGTTTGGCT 694 || | |||||||||| ||||| TTCTTTTACTTGTT 20 BP 99US-00433699 99US-00433699 AAC92586 standard; DNA; 20 (first entry) 16; Conservative Cowsert LM; (ISIS-) ISIS PHARM INC. CC PCR primers AAI65595-AAI65646 were used to amplify polymorphic microsatellite markers, for localisation of a human gene encoding inflammatory bowel disease 1 (IBD1) polypeptide, which is associated with intestinal inflammatory disease. The specification also describes a polypeptide which is in proximity to IBD1, and is designated IBD1prox. The IBD1 gene is probably involved in regulation of apoptosis and activation of NF-kappa B. The IBD1 and IBD1prox polymucleotides are is useful as source of probes and primers, as source of (anti)sense of oligonucleotides, for recombinant production of polypeptides, and in screening for interactive compounds. The polypeptides are used to raise specific antibodies which useful for diagnostic detection or purification of IBD1prox, to screen for specific binding agents, potential the reapeutic agents. The IBD1 and IBD1prox polymucleotides and prevention of inflammatory and/or immune diseases or canner, where associated with mutations in genes corresponding to IBD1 and IBD1prox, especially cryptogenetic inflammation of the intestines (hemorrhagic rectocolitis, Crohn's disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes the human Zmaxi gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmaxi and HBM genes have osteopathic activities. The genes can be used in gene therapy, and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, paget's disease, sclerostosis, osteomalacia and fibrous dysplasia.

The present invention provides the protein and coding sequences of several human cell cycle regulatory proteins. These sequences can be used in the diagnosis and treatment of cancers and other diseases associated with cell cycle abnormalities. The present sequence is a PCR primer described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; PKC antisense oligonucleotide; protein kinase C; PKC; PKC-alpha; PKC-beta type I; PKC-beta type II; PKC-gamma; PKC-delta; PKC-epsilon; PKC-zeta; PKC-eta; PKC expression modulation; Ss; hyperproliferative condition; tumour; glioblastoma; bladder cancer; breast cancer; colon cancer; lung cancer; inflammatory condition;

The invention comprises antisense oligonucleotides designed to bind mRNA encoding a human protein kinase C (FKC) isoform (i.e. FWC-alpha, FKC-beta type I, FKC-beta type I, FKC-gramma, FKC-delta, FKC-epsilon, FKC-ceta, and FKC-eta). The antisense oligonucleotides of the invention are useful for modulating the expression of the PKC isoforms. The antisense oligonucleotides are useful for treating hyperproliferative conditions (e.g. tumour, glioblastoma, bladder cancer, breast cancer, colon cancer antisense oligonucleotides of the invention are also useful for detection and diagnosis of FKC expression. The present sequence represents a human PKC antisense oligonucleotide of the invention. NOTE: The present
                                                                                                                             New antisense oligonucleotide having nucleoside units which specifically binds mRNA encoding human protein kinase C isoform, useful for treating hyperproliferative and inflammatory diseases e.g. psoriasis, tumor and

Decreasing the production of an aberrant protein in a cell, for treatment of inherited diseases such as Duchenne Muscular Dystrophy or Hemophilia, comprises a splice modulation therapy of exons.

Example 1; Page 6; 18pp; English

The present invention relates to a method of decreasing the production of an aberrant protein in a cell containing pre-mRNA of exons coding for the protein, involving providing the cell with an agent capable of specifically inhibiting an exon inclusion signal of one of the exons, and allowing translation of mRNA produced from splicing of pre-mRNA. The new method decreases the production of an aberrant protein in a cell by using a process known as exon-skipping. The process is carried out by providing an agent such as a nucleic acid to inhibit the exon inclusion signal. The nucleic acid agent can therefore be used as a preparation of a medicament for treatment of inherited diseases such as haemophilia A. clotting factor VIII deficiency, some forms of congenital hypothyroidism, Duchenne Muscular Dystrophy. The present sequence is an antisense oligonucleotide directed at the murine dystrophin pre-\*\*\*\*\*\*\*\*\*\*\*\*\*

Arraying genome clones.

Claim 6; Page 54; 528pp; Japanese.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in each of the multiwell plates; (b) a primer descrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals

The present invention relates to a method of diagnosing a cellular proliferative disorder of breast tissue, which involves determining the state of methylation of one or more nucleic acids isolated from the subject, where the state of methylation of the nucleic acids as compared with a state of methylation from a subject not having the cellular proliferative disorder of breast tissue is indicative of a cellular or proliferative disorder of breast tissue in the subject. The nucleic acids proliferative disorder of breast tissue in the subject. The nucleic acids oestrogen receptor, cyclin D2, Wilms' tumour gene (WT-1), 14.3.3 sigma, control or RASSFIA. The method is useful for diagnosing and/or determining a predisposition to a cellular proliferative disorder, in particular carcinoma, tubular carcinoma in situ, lobular carcinoma, colloid carcinoma, tubular carcinoma in situ, lobular carcinoma in situ and carcinoma in situ.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises antisense oligonucleotides designed to inhibit expression of Syntaxin 4 interacting protein. The antisense oligonucleotides of the invention are useful for inhibiting the expression of Syntaxin 4 interacting protein in cells or tissues. The antisense oligonucleotides are also useful for treating an animal having a disease or condition associated with Syntaxin 4 interacting protein (e.g. diabetes, obesity or a skeletal muscle disorder). The antisense inflammation and tumour formation. The present DNA sequence represents a mouse Syntaxin 4 interacting protein antisense oligonucleotide. NoTE: The present sequence contains a phosphorothioate backbone and 2'-0-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                 Mouse, antisense gene therapy, Syntaxin 4 interacting protein, ss; antisense oligonucleotide, diabetes; obesity; skeletal muscle disorder; inflammation; tumour formation; phosphorothioate backbone;
                                                                                                                                                                                                                                                                                                                                                                                                         Novel antisense compound that hybridizes and inhibits nucleic acid molecule encoding Syntaxin 4 interacting protein, useful for treating diabetes, obesity and skeletal muscle disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmaxi. Compounds identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipid-associated conditions, including arteriosclerosis, cardiovascular cateament or prevention of diabetic atherosclerosis, neurovascular conditions caused by plaque build-up, poor circulation due to plaque conditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of Zmaxl and development, in diagnosis of human or animal bone disease, and in the treatment of bone diseases. Sequences ABK22776-ABK21411 represent contact.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
